Abstracts

?-Arbutin(Alpha Arbutin) is a new type of hydroquinone glucoside with an ?-glucosyl bond. The enzyme tyrosinase, one of the key enzymes involved in melanin synthesis, is activated in melanocyte by the stimulation of free radicals induced from UV irradiation and stress. Its activation triggers melanogenesis, a complex series of enzymatic and chemical reactions, and finally leads to the formation of freckles and suntan. The inhibitory effect of ?-Arbutin on melanogenesis is thought to be due to direct inhibition of melanosomal tyrosinase activity.
