Abstracts

Acne is defined as a chronic skin disorder in which the hair follicles become blocked and/or inflamed. There are several variants of acne and they range from mild to severe. The most common type of acne is acne vulgaris (vulgaris means common). Acne appears most often on the face but can also be a nuisance on chest, back and upper arms. Although usually not considered a dangerous medical condition, acne can cause psychological distress and even skin scarring. Teenagers are the most commonly affected group with around 85% of 16-18 year olds believed to have some form of acne. However, some people may suffer from acne well into their 30s and 40s even.
