## Abstracts

Acrylic is the commonly used name for a plastic compound called Polymethyl Methacrylate, or PMMA. It is a type of thermoplastic, which means it can easily be manipulated and formed into various shapes when heat is applied. It is one of the most economical and easily fabricated types of plastic available on the market today. In its film form, it generally comes in a very thin gauge of clear material. Acrylic film features the excellent transparency, weatherability, suitability for heat-molding and lamination processing. In addition, it has outstanding UV protection, making it ideal for use as a construction material, a paint-alternative, and a retro reflective material, as well as for a wide range of applications in the field of optical engineering.
