Abstracts

An actigraph, also referred to as an actometer or actimeter, is a wrist-worn activity monitor that is used to monitor movement and sleeping/waking patterns over an extended time period. The actigraphy device may be placed on the wrist, ankle, or trunk. In most studies, it is worn on the non-dominant wrist since the wrist detects more movement than the ankle or trunk. The actigraphy device includes a small accelerometer that monitors and records the occurrence and degree of motion. It can collect data continuously over an extended period of more than one week.
