Active Fixation Leads Are Pacemaker or Implantable Defibrillator Leads That Are Secured to the Internal Surface of the Heart Using a Design Such As a Spiral. the Leads Are Used to Detect the Electrical System of the Heart and to Conduct Electrical Impulses from the Device Generator to the Heart. Although Passive Fixed Leads with Sharp Teeth Perform Well and Have a Low Migration Rate, They Are Less Reliable when Paced at Nontraditional Sites, and the Development of Active Fixed Leads with Spirals at the Tip Has Improved Pacing Site Selection. These Leads Typically Have a Retractable Screw Made of Platinum-iridium or Similar Alloy, Which is Usually Electrically Active As Part of the Cathode. As the Connector Pin Rotates Clockwise, This End Screw is Deployed, Which Transmits Torque Through the Central Coil Conductor to the Screw Mechanism at the Other End of the Lead. a Few Leads Use a Telescoping Mechanism Driven by a Tubular Core Needle. Some Smaller Diameter Leads Have a Fixed Helix That Requires the Entire Lead Body to Rotate Around the Tubocentric Needle in Order to Deploy into the Myocardium. Steroids Eluting from the Reservoir at the Base of the Helix Help to Suppress the Inflammatory Response Generated by the Traumatic Engagement of the Screw to the Myocardium. Active and Passive Fixation Leads Behave Similarly Overall, with Some Differences Related to Their Construction. Active Leads Tend to Be Easier to Extract, Whereas Passive Leads Tend to Have Lower Chronic Thresholds and Higher Impedances, Thereby Extending the Life of the Pulse Generator. when Using Actively Fixed Leads, Clinicians Must Always Consider the Potential for Perforation and Trauma to Surrounding Structures.
