## Abstracts

Adaptive Driving Beam (ADB) is an intelligent high beam control system that can adaptively change the type of high beams according to road conditions. It turns a complete high beam spot through a special optical module and electronic control into a high beam spot composed of multiple optical lighting divisions. When there are targets such as vehicles and pedestrians on the road, the control system composed of sensors (cameras) and driving circuits will turn off or dim some high-beam lighting partitions, thereby avoiding dazzling the illuminated target and ensuring clear high-beam lighting
