## Abstracts

Submarine is a major weapon in the hands of the navy. Traditional diesel-electric submarines have an underwater endurance of only a few days and they need to surface frequently to charge their batteries. As battery technology improved the endurance of these submarines but it was not enough. While underwater, the batteries on board power the propeller and other electrical systems on the submarine. These batteries run out of charge within 4-5 days and needs to recharge them. This is done by snorkelling, which exposes them to detection by enemy radars and makes them an easy target. Hence we need a system which can allow diesel-electric submarines to recharge their batteries without running their engines. This will allow them to continue sailing underwater and remaining undetected. The system which permits all this is Air Independent Propulsion (AIP). S
