## Abstracts

The Air Supported Belt Conveyors is a belt conveyor that supports the conveyor belt and the material on it with a thin air film. It replaces the roller of the roller belt conveyor with an air chamber disc groove with holes. When the air source provides air with a certain pressure and flow rate into the air chamber, the air in the air chamber escapes through the small holes on the disc groove. , A layer of gas film with a certain pressure is formed between the conveyor belt and the disc groove to support the conveyor belt and its upper materials. The support of rollers arranged at a certain interval is turned into a continuous air cushion support, so that the roller friction between the conveyor belt and the roller becomes the fluid friction between the conveyor belt and the tray groove with air as the medium, which reduces the running resistance. Brings many advantages.
