The Aircraft Condition Monitoring System (ACMS) is a modern airborne data collection and processing system. The system can collect the required airborne system data in real time and transmit the collected data to the ground station in real time by means of measurement and control or satellite communication. Then, the ground station analyzes the data and distributes the results to the corresponding personnel for judgment, so as to realize the condition monitoring, fault diagnosis and positioning of the airborne system, and provide a basis for the decision-making of the ground personnel.
