Abstracts

Machining is an engineering process that is used to obtain the desired shape of the part by various machining processes such as milling, turning, and drilling. The process can also be described as a variety of material removal processes where the cutting tool takes out the undesired metal from the workpiece to build the desired shape of the part. There are two basic types of cutting tools: single-point tool for turning and boring and multi-point tool for milling and drilling. Milling and turning are the two major machining operations through which aerospace structural parts are shaped. In the milling process the cutting tool moves around the workpiece, whereas in turning, the workpiece moves against the cutting tool to obtain the shape.
