Abstracts

In industrial processes, a heat transfer exchanges the heat generated by a device away from that device to a fluid medium, such as air or a liquid coolant. In this manner, the heat is then dispersed, making it easier to maintain the device at optimal temperature levels. This process is commonly employed in numerous household and industrial devices, including computers, semiconductors, and optoelectronics, where the dissipation ability of the part or component is not sufficient enough to regulate the heat by itself. This process is also known as a heat sink.
