## Abstracts

The diagnosis of alzheimer's disease is divided into three steps. The first step is to determine whether it is alzheimer's disease. The second step is to look for the cause, to look for biomarkers such as prolappidin-1, prolappidin-2 and the amyloid gene, amyloid deposition, or hippocampal volume or medial temporal lobe volume atrophy, and the apolipoprotein E4 allele. The third step is to determine the extent of the disease, which can be determined by a simple mental state examination or the patient's response.
