## Abstracts

The patients expired gases are re circulated (where the 'circle' comes from), this means that we do not have to add so much fresh gas to the system like an open system. So the fresh gas flow rate can be reduced to low flow, i.e., 1 l/minute. If the flows were as low as a few hundred cc's of gas, equivalent to the patients metabolic uptake of gases, this would be closed circuit anaesthesia, or metabolic (basal) flow, or minimal flow.
