## Abstracts

Place specific microflora in a tank filled with broth made of water, nutrients, and sugar. And because they have the blueprints, when microflora ferment the broth, they make a pure animal protein without ever touching an animal. The protein is separated from the microflora, filtered, purified, and finally dried. The end product is an extremely pure protein powder ready for use by food makers to make milk (or cheese, or yogurt, or cream cheese...) that's identical to the classic. Some of them can also be used in medical research as pepsin.
