Abstracts

Anionic starches can be prepared by treating an aqueous starch slurry or semi-dry starch paste with an oxidizing agent such as hydrogen peroxide, ammonium persulfate, or sodium hypochlorite under alkaline conditions and at ambient or slightly elevated temperature. Anionic starches degrade much faster than conventional starch. They have improved biodegradability. This type of starch, however, is used on a much smaller scale than cationic starch but it is still an important starch-based additive.
