## Abstracts

An anticaking agent is an additive placed in powdered or granulated materials, such as table salt or confectioneries, to prevent the formation of lumps (caking) and for easing packaging, transport, flowability, and consumption.[1] Caking mechanisms depend on the nature of the material. Crystalline solids often cake by formation of liquid bridge and subsequent fusion of microcrystals. Amorphous materials can cake by glass transitions and changes in viscosity. Polymorphic phase transitions can also induce caking.[2]

Some anticaking agents function by absorbing excess moisture or by coating particles and making them water-repellent. Calcium silicate ( $\text{CaSiO}_3$ ), a commonly used anti-caking agent, added to e.g. table salt, absorbs both water and oil.
