Abstracts

Various biomolecules in the system have a large number of active groups, which must interact with each other to produce chemical reactions and slowly cross-link the biomolecules so as to stabilize the chemical activity. With the passage of time, the degree of crosslinking keeps increasing, the consumption of active groups of biological molecules keeps decreasing, and the original molecular structure gradually changes. The accumulation of these changes will gradually lead to the aging phenomenon of biological tissues. Anti-aging treatments include gene therapy, immunotherapy, attention to diseases of the elderly, and so on.
