## Abstracts

In this era of Information Technology, Application Performance Management (APM) monitors the performance of software applications.

APM ensures that it provides services to the customer up to the level defined and identifies the problems related to the application performance. Application performance can be monitored or tracked using different categories like load time, the response time of the application, etc. Using application performance monitoring (APM) solutions, businesses can monitor whether their IT environment meets performance standards, identify bugs and potential issues, and provide flawless user experiences via close monitoring of IT resources. The best APM solutions provide IT teams with the information they need to connect application performance to business outcomes, as well as identify and fix performance issues before they impact the end-user, and in theory, reducing mean time to resolution (MTTR).
