Abstracts

The smart surgical glasses will become a key tool for significant advances in surgery. When using the medical glasses during surgery, the patient's bones and tissues will be shown on the screen synchronously, allowing the surgeon to focus on the patient without the need to turn and look on another screen. Traditionally, the surgeons need to take a number of radiological images during the entire surgical procedures and need to turn the head numerous times to look into the external monitors for confirmation which somehow affects the surgical procedure time. With the introduction of AR Smart Surgical Glasses, the surgical procedure and the number of duplicate radiological images taken during the surgical procedure can be lowered to a great extent.
