Abstracts

Artificial light aggregate include: shale ceramsite, clay ceramsite, expanded perlite.

Industrial waste aggregate include: fly ash ceramsite, expanded slag beads.

Basically, production of artificial aggregate is using the same principle which is mixing of raw materials, agglomeration, hardening or binding of the particles and then further processing like curing and sintering. Desired size of artificial aggregate is obtained according to the application by agglomerate any raw waste materials during the production process of artificial aggregate. A process such as sintering, autoclaving and cold bonding are the general 3 methods to produce artificial aggregate after the mixing of raw materials, agglomeration, hardening or binding of the particles. The common method to obtain a lightweight artificial aggregate is through sintering process.
