The artificial organs are devices implanted or integrated into a human body in order to replace a natural organ, for the purpose of duplicating or augmenting a specific function or a group of related functions for the patient to return to a normal life as soon as possible, whereas bionics is the application of biological methods and systems found in nature to the study and design of engineering systems and modern technology. The increasing mortality rate of patients awaiting organ transplant has intensified the demand for artificial organs. The artificial vital organs and medical bionics market is undergoing impressive growth across the globe due to increase in the gap between patients awaiting organ transplant and the availability of donor organs.
