Abstracts

Asthma is a chronic respiratory condition that affects millions of people around the world. Aerosol drug delivery is the first line administration route in asthma management, and metered dose inhalers (MDIs) are the most common type of inhalers used in asthmatic conditions. However, poor inhalation techniques have led to poor control of asthma. Valve holding chambers/spacers are designed to counter the problem. A spacer, usually attached with an MDI, is an external device that provides better drug delivery by increasing inhalation and actuation.
