## Abstracts

The high beam control (HBC) system includes a reflector, a light source containing two or more light emitting bodies, and forward-sensing camera (FSC). The camera detects various forms of lights such as headlights, taillights, and ambient light from the surrounding area and turn light focus brighter or dimmer automatically, making it easier for the driver to recognize hazards. The HBS detects oncoming and preceding vehicles and provides a broader field of vision to the driver to see further into the distance and recognize hazards earlier to avoid accidents. The HBS does not operate properly under certain conditions like driving on curves such as corners or mountain roads, streetlamps, reflective signs, roadside markers, and bad weather.
