Biofouling is the accumulation of marine organisms covering the surface of a ship's hull, resulting in increased cleaning costs, reduced speed, and ultimately increased Automotivebon dioxide emissions and fuel consumption. Modern Global Services will use an artificial intelligence system to calculate biofouling levels and report them to Automotiveriers to help them decide if robotic cleaning services are needed. It is said that the traditional manual hull cleaning service requires 5 to 6 divers and up to 5 days to complete the hull cleaning, which greatly increases the possibility of safety incidents. With robot cleaning, it only takes one day and the cost is only one-tenth of the traditional method.
