Abstracts

An ideal automotive battery must be capable of offering adequate reserve capacity, which signifies the amount of electrical energy that the battery can deliver when it is fully charged. Some of the rankings that are commonly used to measure battery performance include cold cranking amperes (CCA), amp-hours (AH), power (Watts), and reserve capacity (RC).

Successful manufacturing of an EV requires the implementation of supportive policies by federal, state, and area administrative bodies to sustain long-term benefits. Electric utility providers are also required to develop a uniform platform and provide operational support for EVs. Favorable regulatory policies can provide a phenomenal push to sales of electric vehicles, which in turn can help the automotive battery market to gain tremendous momentum over the forecast period.
