## Abstracts

An automobile heat exchanger is a device designed for the purpose of allowing heat transfer from one medium to another at different temperatures. Most commonly, these mediums consist of two fluids that flow close to each other and are separated by a material, often metals, with good heat transfer properties. The fluids are primarily characterized by their temperatures at the entrance to the heat exchanger. The hot (warm, in figure below) fluid, the fluid with the highest temperature initially, transfers heat to the cold fluid as they both pass through the heat exchanger, thus lowering the temperature of the hot fluid and raising the temperature of the cold fluid.
