## Abstracts

Hidden behind the front windshield, it can adjust the action of the wiper according to the amount of rain falling on the glass, thus greatly reducing the troubles of drivers. Rainfall sensor does not change the speed of the wiper with a few limited gears, but adjusts the speed of the wiper steplessly. It has a light-emitting secondary tube called LED, which transmits far-infrared rays. When the glass surface is dry, the light is reflected back almost 100% so that the photoelectric secondary tube can receive a lot of reflected light. The more rain on the glass, the less light reflected back. As a result, the faster the wiper moves.
