## Abstracts

Automotive Brake Override System is an active vehicle safety feature designed to work as a failsafe measure in the event that your vehicle receives mixed signals (i.e., the gas and the brake are pushed down simultaneously) or an electrical malfunction causes the vehicle to continue accelerating even when the driver's foot is on the brake. In vehicles with brake override, the brake pedal is enhanced with "smart" technology that detects when something abnormal occurs. For example, brake override can detect if the brake pedal and accelerator are pushed at the same time. It recognizes that this is not how people normally drive, and corrects the problem by overriding the accelerate command and bringing the vehicle to a safe stop.
