Abstracts

Automotive brake shims in the automotive brake shims market are made of slim layers of rubber or metal adhesive pads and are placed between the brake caliper and the brake pad to reduce the brake noise. Automotive brake shims are used in disc brake systems, which minimize excessive noise generated by disc brakes, thereby stopping the movement of the wheel hub assembly (WHA). Automotive brake shims also improve brake quality and reduce the vibration of the calipers and brake pads. They are used in different vehicles, including two-wheelers and four-wheelers. Also, the automotive brake shims are employed in passenger vehicles and commercial applications. An automotive disc brake is installed on the front or rear side or both sides of the wheel hub. Automotive brake shims are designed to provide a multifunction noise control system and act as a component attached to the friction pad backing plate.
