Abstracts

A gateway is a central router that securely and reliably interconnects and transmits data across multiple different networks within a vehicle. It interacts information between functional domains (powertrain, chassis and safety, body control, infotainment, telematics, ADAS) that share data through physical isolation and protocol transformation. Vehicles increasingly rely on electronic control units (ECUs) to enhance the driving experience. As a communication bridge between various ECU networks, gateway controller through the external interface (including high and low speed CAN, LIN, Ethernet protocol) to achieve data exchange, play a fundamental role.
