Abstracts

Automotive chain sprocket or automobile sprocket wheel is a specific type of wheel with teeth or cogwheels, which are drive parts that engage with chains, tracks, or other perforated or concave materials. The difference between automobile sprockets and gears is the design of making sprockets, moreover, sprockets never engage directly with each other. They cannot be compared with the pulley, which is smooth, whereas the sprocket has teeth. With the track of the vehicle, the movement to the track of the gear is called the transmission sprocket. Automobile sprocket wheel is an important tool for automobile manufacturing in various industries such as automobile, track car, motorcycle, bicycle and other products. They involve passing rotational motion between the two axles where the gear is found, promoting the motion of the car.
