Abstracts

Chassis is the skeletal frame of the vehicle which supports the components and sub-assemblies of the vehicle. The chassis is the key frame which provides rigidity and strength to the vehicle. Typically, carbon steel or aluminum alloy undergoes a variety of processes such as forging, stamping, and welding in order to obtain the frame structure. The Car manufacturer Ariel developed a titanium chassis for its Atom sports car that is 40% lighter than the steel chassis. The usage of titanium in chassis building leads to a reduction in weight and increase in fuel efficiency and titanium market is projected to expand particularly in motorsport vehicles.
