Abstracts

The shift to electrification from manual transmission is one of the biggest changes in the automotive industry. The automotive drivetrain is the component of the vehicle that includes drive shafts, wheel, axles, U Joints, CV joints, and transmission. All the parts of the drivetrain are responsible for providing transmission so as to move the wheels of the vehicle forward. In other words, it transfers power to the wheels of the vehicle. The driveshaft is the long steel structure in tubular form that is linked with the gearbox of the vehicle to provide the rotary movement in the wheel. Universal joint is the main component that allows the wheel to move in different angles. Axle is the connected shaft between the wheels and the drive system and provides the transmission power to the wheel for making it rotate. Drivetrain is also called powertrain train. The only difference is that the powertrain consists of whole system that provides power to the wheels while drivetrain consists of components that link the driveline and wheel. In future, electric drivetrain will replace manual transmission drivetrain because of its better efficiency and environment friendliness.
