Abstracts

Automotive engine mounts are rigid mounts or clamps that secure the engine to the vehicle body. These are usually made in such a way that they transfer the transmission of vibrations from the frame to the engine, and in order to achieve the best vibration isolation of the powertrain, the mounting system is useful for mounting the powertrain. The carrier system provides isolation, minimizing the force transmitted to or from the chassis. Moreover, it suppresses engine bounce caused by vibration. This can be achieved by making the mounting system's damping and stiffness dependent on amplitude and frequency.
