Abstracts

Automotive Engine Cooling Radiators are heat exchangers used for cooling internal combustion engines. Internal combustion engines are often cooled by circulating a liquid called engine coolant through the engine block, and cylinder head where it is heated, then through a radiator where it loses heat to the atmosphere, and then returned to the engine. Engine coolant is usually water-based, but may also be oil. It is common to employ a water pump to force the engine coolant to circulate, and also for an axial fan[1] to force air through the radiator.
