Fuel has a tendency to expand its volume when heated and shrink when cooled. This causes the fuel level in an automobile to change, even when the vehicle is stationary, which creates the need for the fuel tank to breathe in order to relieve the vacuum and pressure formed inside the tank due to a change in the volume of the fuel. Insufficient venting can cause various issues in the fuel system, ranging from vapor-lock to fuel spills. An automotive fuel vent valve enables the fuel tank to release pressure or vacuum when fuel is being pulled from the tank or filled. These valves also have a rollover protection feature to avoid spillage during accidents.
