Abstracts

Automotive Gear Position Sensor is a car part that monitors your shift rail's position inside your vehicle's gearbox. It was developed to observe, supervise, and inspect the position of the shift rail (detecting selection of up to five gears) through a combination of two or three sensors like it in each transmission. Many modern automobiles include these sensors that send info that's important to the overall operation of your control modules. Changing gearshift variables will affect your gear position sensor (also known as GPS but not to be confused with the Global Positioning System)
