Bone density or bone mineral density (BMD) is the amount of bone mineral in bone tissue. Bone density measurement is used in clinical medicine as an indirect indicator of osteoporosis and fracture risk. Bone densitometers are known to offer improved diagnostic sensitivity in cases of osteoporotic fractures, playing a vital role in diagnosis of fracture before it could occur. It is measured by a procedure called densitometry, often performed in the radiology or nuclear medicine departments of hospitals or clinics. The measurement is painless and non-invasive and involves low radiation exposure.
