## Abstracts

The power amplifier is the main component of the RF front-end transmission path. It is mainly used to amplify the low-power RF signal generated by the modulation oscillation circuit to obtain a sufficiently large RF output power before it can be fed to the antenna for radiation. It is usually used to implement the transmission channel RF signal amplification. High-density networking (UDN) and full-spectrum access in 5G key technologies will bring about an increase in the number of base stations and a further widening of the spectrum, and will bring more demand for terminal RF devices.
