Abstracts

A beam twister is used to rotate the beam emitted by the individual diodes in the laser bar by 90°. When the light is initially emitted from the laser rod, the light appears to be in the shape of a line. After passing through the beam twister, the 90° rotation transforms the light emission of the laser rod into a square appearance. A square is good for straight lines because it allows the beam to be focused to a point for use in fiber optics or other beam delivery systems. The beam twister assembly consists of a fast axis collimator and a rotating array pre-assembled for use.
