## Abstracts

Biodegradable gastrointestinal stents are a promising alternative to permanent stents, made of biodegradable materials such as polyesters, polycarbonates, bacteria-derived polymers, and corroded metals. It may eventually be used to address the long-standing problem of in-stent restenosis. In addition, fully degradable stents are able to deliver more drug to the target site than thin drug coatings on metal stents. Biodegradable gastrointestinal stents are gradually absorbed by the gastrointestinal system, and they help maintain the patency of the gastrointestinal tract for a predetermined period of time.
