## Abstracts

Biologic excipients are compounds excluding the pharmacologically active drug component that are used in the synthesis of biologic drugs or are found in the dosage form of a finished pharmaceutical product. They help with formulation design and have a variety of functions, including boosting flow ability, improving flow ability, and increasing compressibility. The biologic excipients market is developing due to rising demand for prolonged or sustained-release formulations and increasing demand for biologic excipients. During the projected period, growing regulatory stringency regarding medication and excipient approval is expected to restrain the market's growth. Patient safety is dependent on the quality of pharmaceutical excipients throughout their life cycle. Low-quality excipients' effects, such as decreased API solubility, have enhanced the necessity of managing many parts of the excipient life cycle, such as design, production and transportation.
