Abstracts

As population growth demands increased food security, advances in farming methods and technologies, and changes in climatic conditions conducive to disease, agriculture will grow significantly. Fungicides are highly used to destroy harmful fungi that affect crop yields. Therefore, fungicides are increasingly required worldwide to reduce crop losses. Biofungicides or biofungicides include beneficial microorganisms for controlling fungal diseases. Many of these beneficial microorganisms are naturally present in the soil. Biological fungicides are usually used before the disease occurs. If used in conjunction with good agricultural practices, their efficiency will increase. Biofungicides have different modes of action, such as competition / exclusion, antibacterial, parasitic, inducing resistance and promoting plant growth. Demand for fungicides is expected to remain high in various regions due to the increased variety of crops grown in large numbers.
