Abstracts

Biopolymers/bioplastics is a material for which at least a portion of polymer consists of material produced from biomaterials. It represent a new generation of plastics that reduces the impact on the environment, both in terms of energy consumption and the amount of greenhouse gas emissions.

Bioplastic utensils are different from plastic ones in that they are derived from natural resources, hence “bioplastic” Whereas plastic utensils are constructed from petroleum, bioplastic utensils come from plants that are found naturally in the environment, such as corn, sugarcane, grass, bamboo, and other such materials. Therefore, because they are constructed of natural materials, they will more easily break down and decompose than traditional plastic will.
