Abstracts

Blood gas and electrolyte analyzers are used to measure different parameters from whole blood samples, such as pH, blood gas (pCO₂ and pO₂), electrolytes, and metabolites. The pH value of blood and serum or plasma is an indicator of the balance between the blood, renal (kidney), and lung (respiratory) systems, while the pCO₂ value of arterial blood is used to assess efficient elimination of carbon dioxide from the body, a by-product of metabolism; and the pO₂ value of arterial blood is a measure of oxygen absorbance by the body in the lungs. Electrolytes and metabolites give further information about body metabolism.
