Abstracts

Blood plasma is the liquid component of blood constituting of water along with plasma components such as immunoglobulin, electrolytes, glucose, clotting factors, electrolytes, and hormones. It plays a crucial role in maintaining the electrolyte and osmotic balance while preventing infection and blood disorders in the body. Plasma derivatives are the concentrates of specific proteins, which require pooling of plasma from large number of donors. For instance, they require more than hundred plasma donations to produce sufficient immunoglobulin to treat an immune-deficient patient for one year. They are obtained by the process of fractionation where protein concentrates are separated and then clinically used.
