Abstracts

Blue light treatment, also called PDT, uses light to treat certain conditions on or just under the skin. It's considered a pain-free procedure. Blue light treatment becomes photodynamic therapy when it uses a combination of photosensitizing (or light-sensitive) drugs and a high-intensity light source to activate them. The light used is a natural violet or blue light, and it's considered to be an alternative treatment. Blue light therapy can only treat areas that the light can reach. So it's typically used to treat conditions present on, or just underneath, the surface of the skin.
