Abstracts

Borehole Seismic Survey is one of the most versatile downhole measurement techniques employed in exploration of oil and gas resources. Borehole seismic survey, also known as vertical seismic profile (VSP), results in linking of time-based surface seismic images with depth-based well logs. However, with the advent of technology, borehole seismic surveys have expanded beyond the time depth correlation, due to development of improved data acquisition tools. They provide important information to exploration and production companies. From this information, these companies derive data about depth, extent, and heterogeneity of reservoirs, pore pressure, mechanical properties of rocks, fluid content, etc.

This report contains market size and forecasts of Borehole Seismic Survey in Global, including the following market information:
