Abstracts

The car crash simulation is a virtual recreation of a destructive crash test of a car or a highway guard rail system using a computer simulation in order to examine the level of safety of the car and its occupants. Crash simulations are used by automakers during computer-aided engineering analysis for crashworthiness in the computer-aided design process of modelling new cars. During a crash simulation, the kinetic energy, or energy of motion, that a vehicle has before the impact is transformed into deformation energy, mostly by plastic deformation of the car body material, at the end of the impact. Automotive crash impact simulator is a device that provides this kind of analysis.
