Abstracts

Cardiac POC is a medical test performed to diagnose patients. The cardiac POCs are blood tests including cholesterol and coagulation testing. These include brain natriuretic peptide tests and troponin. Troponin are used to analyse various cardiovascular conditions such as coronary syndromes, heart failures and acute myocardial. The cardiac POCs help in enzyme detection which is released during critical cardiac conditions such as troponin, lactate, dehydrogenase isoenzymes and brain natriuretic peptides. In addition, it also helps in detection of enzymes released during failure of the heart. Cardiac POCs are helpful in diagnosing specific diseases such as myocardial infarction and angina. Cardiac POCs provides accurate information related to the markers which are released during heart failure. These tests help in reducing turnaround time from testing to final results of the patient's diagnosis. Thus, helps in providing effective treatment to the patients.
